# ALL A RARE CHILDHOOD CANCER

GLOBALLY  
2 IN 100,000  
ANNUAL INCIDENCE<sup>1</sup>

USA  
~3,000  
ANNUAL INCIDENCE

INDIA  
~6,000  
ANNUAL INCIDENCE<sup>2</sup>

Acute Lymphoblastic Leukemia (ALL) is a cancer of the blood and bone marrow. ALL is the most common type of childhood cancer yet it is considered a rare disease. ALL is curable with survival rates up to 90% in developed economies under a standardized chemotherapy regimen but fatal if untreated.

ALL is a **rare disease** and occurs **2 in 100,000** people annually<sup>1</sup>. The risk of developing ALL is highest in children below 5 years of age and in adults above the age of 50.

Globally, there are more than **0.8 million** prevalent cases of ALL. There are about **15,600 prevalent cases in India** making ALL the commonest cancer in children<sup>2</sup>.

## CURRENT TREATMENT ISSUES

Asparaginase, an enzyme obtained from microbial source is a critical component of multidrug treatment of ALL. There are three kinds of asparaginase available in the market

- Native asparaginase from *E. coli* – native asparaginase
- PEGylated version of the native asparaginase from *E. coli* – Pegaspargase
- Native asparaginase from *Erwinia chrysanthemi* – Erwinase

Patients develop hypersensitivity to 'native asparaginase', since it is obtained from a microbial source, and need to be switched to pegaspargase, the PEGylated form of 'native asparaginase'.

Since hypersensitivity is a known outcome, in developed nations pegaspargase is used as a first line treatment and Erwinase as second line treatment for ALL. **Pegaspargase** is very expensive and thus forces the developing countries to use the non-PEGylated version, 'native asparaginase', which invariably sensitizes the patients during a course of chemotherapy.

Pegaspargase is preferred over native asparaginase due to its longer half life, the requirement of fewer dose and sustained therapeutic activity through the course of treatment.

**There are two major problems with pegaspargase - affordability and accessibility.**

The current treatment is very expensive and the liquid preparation has inherent **challenges with cold-chain shipment, handling, and storage** of this drug in harsh environments prevalent in India and other tropical countries.

### Asparaginase from *E. coli*

- First line therapy in developing countries
- Discontinued in US
- Low quality and low bioavailability of all generics

### Pegaspargase

- First line therapy in developed countries
- Second line therapy in developing countries
- Innovator product expensive and need to be imported

### Asparaginase from *Erwinia*

- Second line therapy in developed countries
- Very expensive and not available in developing countries including India.

Pegaspargase is prepared by the pegylation of native *E. coli* asparaginase.

Pegaspargase is safe, effective, and economical for the treatment of ALL considering the half-life and hypersensitivity of the native L-Asparaginase. Considering these facts **pegaspargase has been included in the WHO essential list of medicine 2021<sup>3</sup>.**

### GENNOVA'S INNOVATION

**Gennova is committed to this orphan disease and is walking the path to create solutions for various asparaginase formulations.**

The development of recombinant asparaginase is a novel way of ensuring quality as it is governed by stringent regulatory rules which are globally harmonized.

**Gennova was the first company in India to rise to the cause of the ALL, an orphan disease.** In 2014, Gennova launched an affordable quality-assured pegaspargase, **Hamsyl<sup>®</sup>**, bringing the **drug cost down to one-third the price of the innovator product.** This launch ensured that patients of ALL in India have access to the best medications. The product quality was **independently attested by the paediatric and haematology clinical community** & this is the only generic to **establish its clinical bioequivalence with the innovator product.**

Gennova's **innovation around high cell density fermentation, genetic manipulations for its microbial products, and cost-effective PEGylation technology** puts itself in a unique position to address the availability of the asparaginase portfolio of products.

Gennova has developed a novel storage stable formulation of pegaspargase and **have filed Patent Corporation Treaty (PCT) to protect its IP.**

## CLINICALLY PROVEN TO BE BIOEQUIVALENT TO INNOVATOR PRODUCT

### Randomized, Parallel Group, Open-Label Bioequivalence Trial of Intramuscular Pegaspargase in Patients With Relapsed Acute Lymphoblastic Leukemia

Manjunath Nookala Krishnamurthy, MBBS, MD, DM<sup>1,2</sup>; Gaurav Narula, MBBS, MD, DM<sup>2,3</sup>; Khushboo Gandhi, MPharm, PhD<sup>1</sup>; Ankita Awase, MSc<sup>1</sup>; Ruta Pandit, MPharm<sup>1</sup>; Sunil Raut, MSc<sup>1</sup>; Ritu Singh, MPharm<sup>1</sup>; Vikram Gota, MBBS, MD<sup>1,2</sup>; and Shripad Dinanath Banavali, MBBS, MD, DM<sup>2,3</sup>

**PURPOSE** Pegylated asparaginase is comparatively safer than native asparaginase in the management of acute lymphoblastic leukemia (ALL). However, the high price and nonavailability in low- and middle-income countries limits its use. In 2014, the first generic of pegaspargase (Hamsyl) was approved in India for use as a second-line treatment option for ALL. The aim of this study was to assess whether the generic pegaspargase (the test product) was bioequivalent with the reference product (Oncaspar).

Mean ± standard deviation of L-asparaginase plasma activity–time profiles in the test and reference arms

### Human Clinical Study<sup>4</sup>

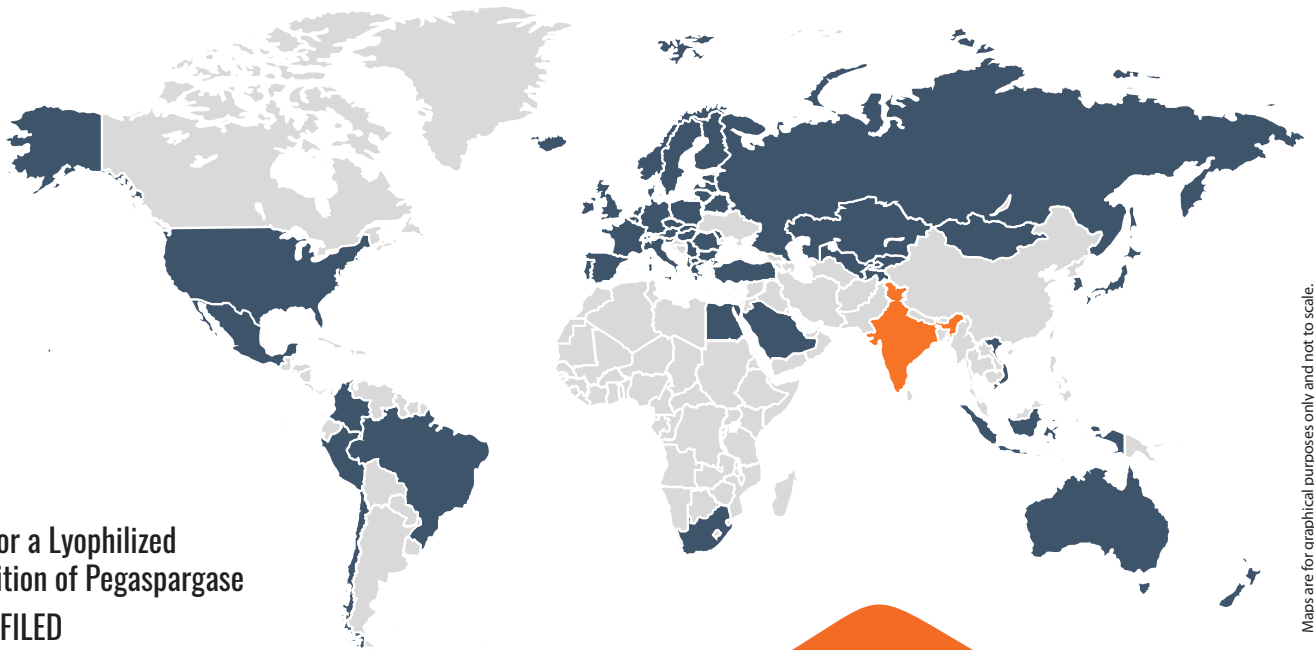

A prospective, open label, randomized, active control, parallel design, comparative PK study of IM Hamsyl<sup>®</sup> versus Oncaspar<sup>®</sup> in pediatric patients with relapsed cases of ALL

- Hamsyl<sup>®</sup> is bioequivalent to innovator product in this study.
- Trough asparaginase level of >100 IU/L with Hamsyl<sup>®</sup> at 1000 IU/m<sup>2</sup> observed to be comparable with innovator product.
- Overall survival rate of Pegaspargase treatment in relapsed cases of ALL >70% at 2 year.
- Hamsyl<sup>®</sup> was well tolerated and found to be safe and efficacious in the relapsed patients of ALL.

**Gennova Biopharmaceuticals Limited**, headquartered in Pune, India, is a biotechnology company dedicated to the development, production and commercialization of bio-therapeutics to address life-threatening diseases across various indications. Incorporating recombinant DNA technologies together with innovative bio-manufacturing practices, Gennova has created cost effective solutions for manufacturing and successfully commercializing bio-therapeutics across cardiovascular, neurology, nephrology and oncology markets. Gennova has developed an mRNA-based platform technology for a COVID-19 vaccine.
